

New Features in WorkShop v7.0!

Language Settings by User - This potent new feature allows each user to be assigned a default **Language** on the *User Login Options* screen. It is now possible for one WorkShop user to be running in English while the user next to him is running in Spanish!

The **Language** settings support more than just different languages.

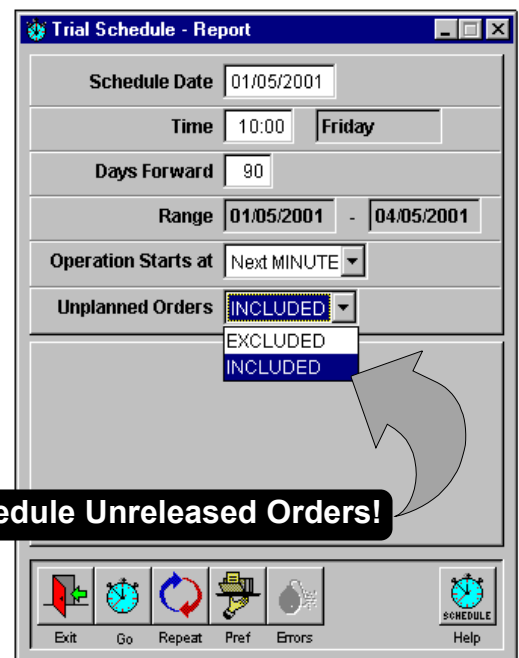

Each user can have a personalized **Language** set! Screens can be sized to their specifications! Screen and report options can be preset! Even the menu structure can be tailored to show only the areas of WorkShop that they are allowed to work within! No matter what workstation they log onto, they will receive their own customized version of WorkShop!

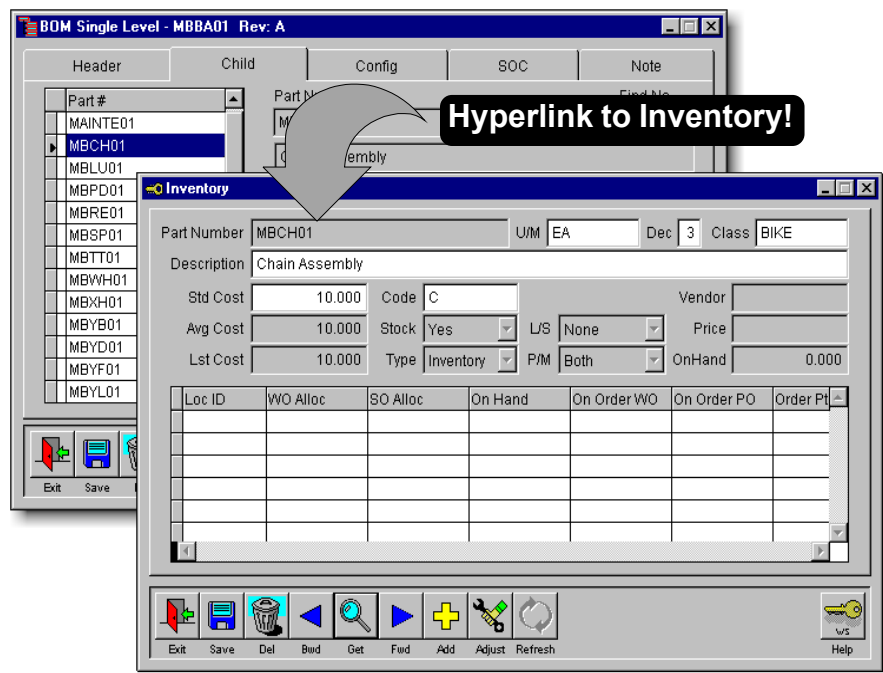

Expanded Developers Kit - Custom changes are automatically integrated into new releases with little or no updating required! Menus and forms are enhanced to allow extensive control and changes. The enhancements include the capability to provide customized menus and reports by user! The Developers Kit Manual has been rewritten to incorporate the technical advances of the last year!

Scheduling Unreleased Work

Orders - The scheduler can include Work Orders that have not been released through the FPO process. By including the unplanned orders in the Trial schedule, their estimated completion dates can be calculated without making them part of the actual production schedule! You can choose which unreleased orders to include by setting their priority to *Active*, *Priority* or *Maintenance*. These orders can be included in the advanced planning and scheduling functions since the MRP process can use either the *Trial* or *Implemented* schedule! This allows the scheduling of unreleased orders and the coordination of the material planning required to support them at the production floor level!

BOM Child Hyperlinks - Child records on the BOM Child tab are hyperlinked to the inventory list! Simply highlight a child record and open the *Inventory* screen in the WS Module. It will automatically find and display the inventory information on the child! This is an excellent way to validate inventory settings and check stock levels!

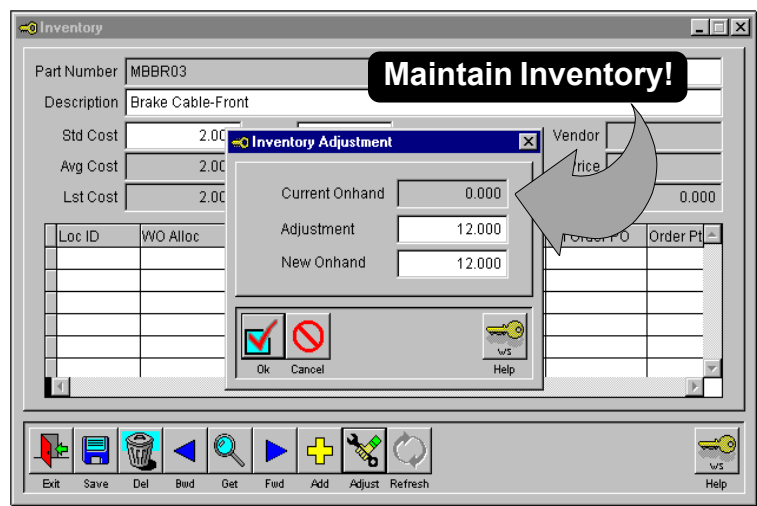

“Needed By” Accepts Prior Dates - The *Needed By* date on work orders has been changed to accept dates prior to today's date. This allows users to enter the date the order is due even if it was prior to the creation of the work order. The date in this field is one of the prime criteria for setting scheduling priorities. Thus, entering dates earlier than today will affect the scheduled completion dates of other orders.

Adjust Finished Quantities - An **Adjust** button has been added to the *Material Order* screen on the *Status* tab and allows the quantity being manufactured to be changed before posting the finished goods to inventory! Now, when you use material orders and make more or less with the material allocated for the job, you can post the correct quantity to inventory with one easy step!

Maintain Inventory - The inventory capabilities have been expanded to strengthen WorkShop's ability to operate independently!

An **Adjust** button has been added to the *Inventory* screen and is only active when WorkShop is not linked with an accounting system. The button will allow you to adjust the on hand quantity. WorkShop will automatically maintain the quantity when issuing material or receiving finished goods from manufacturing orders. The **Adjust** function can supplement this process by allowing you to enter beginning inventory, receive purchased quantities, and make adjustments based on physical inventory counts!

Automatic Quoting - Now, when a work order is released through the FPO process, WorkShop will automatically generate a quote in the Cost Module. Quoting is important because it allows the tracking of material, labor, and overhead variances throughout the life of the order. The automatic quoting feature removes a manual step that is easy to forget. It will even look to see if a previous quote has been saved before the FPO process and preserve it!
