

# New Features in WorkShop® v7.6!

**Finished Good Location Defaults** - The recent introduction of ALERE™ Accounting, with its host of new features, allows the capabilities of WorkShop to be expanded. The first area to benefit is the work order.

The ALERE Inventory Module supports default locations for each item. That means that when a work order is created the default Location, Store, and Bin can now be looked up for the item and automatically entered on the work order!

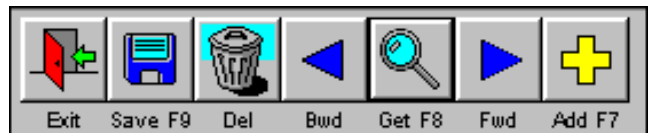

**Reset Utility for Plan** - A new utility in the Plan Module extends the functionality of the material planning process by allowing the records from previous calculations to be quickly cleared. This benefits you by making it easy to switch between running MRP for a group of locations and running it for a single location!

**Diskless Workstation Installation** - Here is a great way to quickly install WorkShop on a workstation without a CD! Just double click on SETUPMU.EXE and the install process for the workstation is automatically started! The program can be found in the WorkShop program directory and is optionally installed during the server installation.

**ALERE™ Accounting Links** - With ALERE finalized and released to the market, WorkShop is now fully integrated! A complete ERP package, with extensive features, is now available at an affordable price! All from one vendor - TIW!

**WorkShop®/SOC Links to Build 2501** - For our users who operate on the SOC/Pro/WorkShop platform, we have included in this release compatibility with ACCPAC Pro Series Build 2501! This includes instructions for the new SOC hooks in the Sales Order Module!

**Special Function Keys** - To make life a little easier, the special function keys to use for Add (F7), Get (F8), and Save (F9) have been added to the buttons on each screen!

**The Most Used Special Function Keys  
Right On the Buttons!**

**Resets Plan Tables!**

**Quick and Easy!**
